Treatment-resistant hypertension is associated with a substantially increased risk of CV events

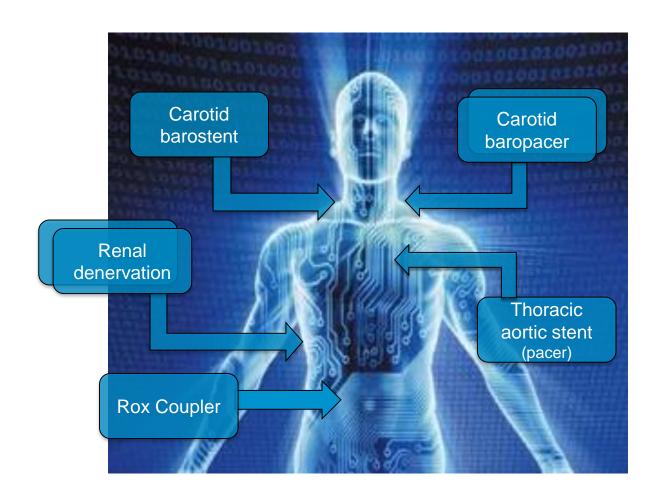

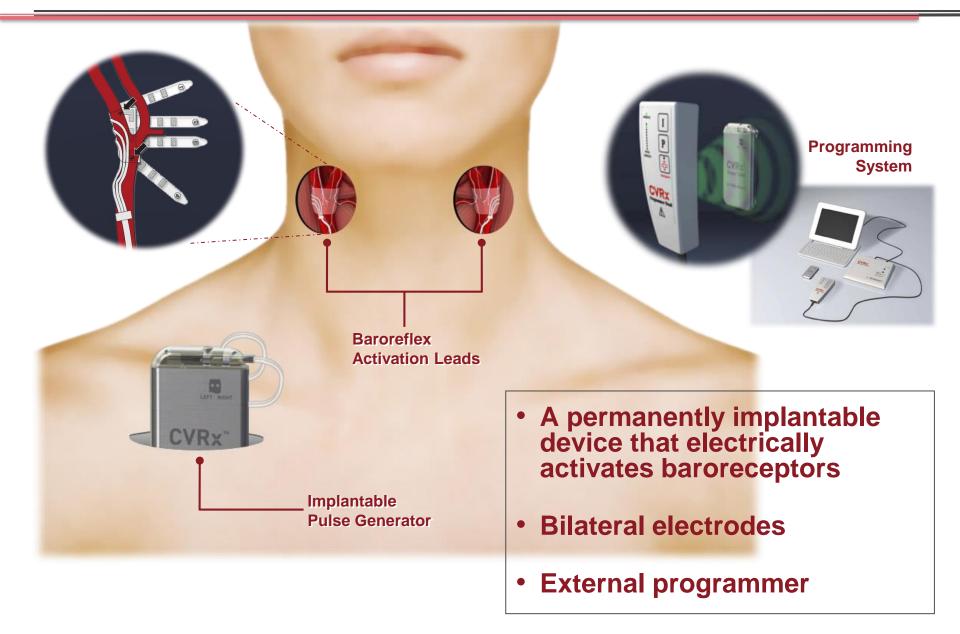

(5-year follow-up)	
Controlled Hypertension	5%
Treatment Resistant	19%

Differences between groups were apparent from very early in the follow-up period, indicating the urgent need for BP control in patients with treatmentresistant hypertension.

Cost-effectiveness of Barostim therapy for the treatment of resistant hypertension in European settings

Oleg Borisenko^a, Joachim Beige^b, Eric G. Lovett^c, Uta C. Hoppe^d, and Staffan Bjessmo^e

- Additional life-years gained = +1.66 vs.
 optimal medical therapy
- Additional Quality-Adjusted Life-years gained
 +2.17 vs. optimal medical therapy
- Cost per QALY gained: EUR 7,797 vs.
 standard threshold of EUR 35,000 per QALY
- Deemed cost effective relative to optimal medical therapy

QALY Gain	+2.17
Reduces rate of:	Ву:
Myocardial Infarction	19%
Stroke	35%
Heart Failure	12%
End Stage Renal Disease	23%

Barostim is a Cost-Effective Therapeutic Option Over the Long-Term compared to optimal medical therapy

Patient Selection

- BAT should be considered in patients with resistant hypertension
 - office cuff BP > 160/90 mmHg
 - after lifestyle modification and
 - at least 3 antihypertensive drugs (incl. diuretics)
 - initiation of MRA treatment (i.e. spironolacton) prior to BAT evaluation

End organ damage

- BAT in heart failure: symptomatic improvement
- BAT in renal failure: potentially nephroprotective

Exclusion

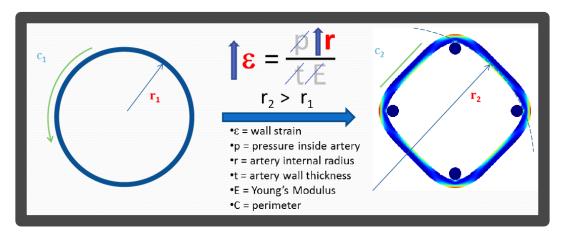

- pseudoresistance and/or secondary causes
- carotid artery disease (> 50% stenosis)

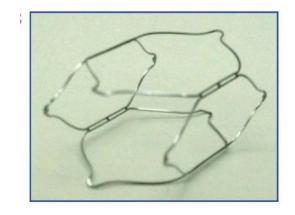

NEW KID ON THE BLOCK?

EBA with MobiusHDTM device

Endovascular prosthesis for amplification of the carotid baroreceptor signal

Mechanism of Action

- Deployment of the device reshapes the artery
- The reshaped artery leads to an increased effective radius of curvature of the artery
- The increased effective radius amplifies the signals detected by the baroreceptors

Endovascular baroreflex amplification for resistant hypertension: a safety and proof-of-principle clinical study

Wilko Spiering, Bryan Williams, Jan Van der Heyden, Monique van Kleef, Rob Lo, Jorie Versmissen, Adriaan Moelker, Abraham Kroon, Hannes Reuter, Gary Ansel, Gregg W Stone, Mark Bates, for the CALM-FIM_EUR investigators*

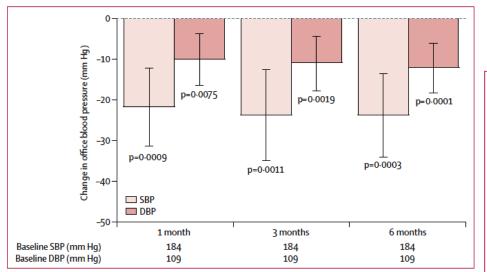

Lancet 2017;390:2655

Summary

Background Carotid baroreflex activation lowers blood pressure and might have potential application for the treatment of resistant hypertension. We did a proof-of-principle trial with a novel endovascular baroreceptor amplification device, MobiusHD (Vascular Dynamics, Mountain View, CA, USA), in patients with resistant hypertension.

Office BP

- Number of meds: - 0.5

- OBP: $22(73\%) \ge 10 \text{ mmHg}$ - ABP: $25(83\%) \ge 5 \text{ mmHg}$

Ambulatory BP

Summary – baropacing

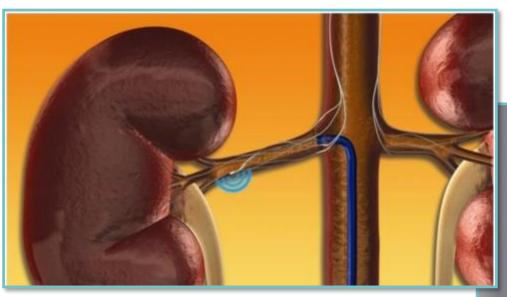

- Baroreflex activation therapy
 - sustained BP lowering for at least 5-6 yrs
 - safety comparable to pacemaker implantations
- ± 50% of TRH patients reach SBP threshold <140 mmHg
- Efficacy of 2nd generation device is likely to be identical to 1st generation
 - Barostim neo: significant ambulatory Δ BP \pm 10/5 mmHg
- Longterm treatment: reduces target organ damage
- BAT is a cost-effective therapy in resistant hypertension in Europe

Catheter-based renal denervation in patients with uncontrolled hypertension in the absence of antihypertensive medications (SPYRAL HTN-OFF MED): a randomised, sham-controlled, proof-of-concept trial

Raymond R Townsend, Felix Mahfoud, David E Kandzari, Kazuomi Kario, Stuart Pocock, Michael A Weber, Sebastian Ewen, Konstantinos Tsioufis, Dimitrios Tousoulis, Andrew S P Sharp, Anthony F Watkinson, Roland E Schmieder, Axel Schmid, James W Choi, Cara East, Anthony Walton, Ingrid Hopper, Debbie L Cohen, Robert Wilensky, David P Lee, Adrian Ma, Chandan M Devireddy, Janice P Lea, Philipp C Lurz, Karl Fengler, Justin Davies, Neil Chapman, Sidney A Cohen, Vanessa DeBruin, Martin Fahy, Denise E Jones, Martin Rothman, Michael Böhm, on behalf of the SPYRAL HTN-OFF MED trial investigators*

Summary

Background Previous randomised renal denervation studies did not show consistent efficacy in reducing blood pressure. The objective of our study was to evaluate the effect of renal denervation on blood pressure in the absence of antihypertensive medications.

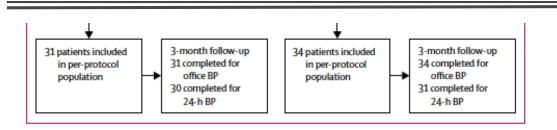

Methods SPYRAL HTN-OFF MED was a multicentre, international, single-blind, randomised, sham-controlled, proof-of-concept trial. Patients were enrolled at 21 centres in the USA, Europe, Japan, and Australia. Eligible patients were drug-naive or discontinued their antihypertensive medications. Patients with an office systolic blood pressure (SBP) of 150 mm Hg or greater and less than 180 mm Hg, office diastolic blood pressure (DBP) of 90 mm Hg or greater, and a mean 24-h ambulatory SBP of 140 mm Hg or greater and less than 170 mm Hg at second screening underwent renal angiography and were randomly assigned to renal denervation or sham control. Patients, caregivers, and those assessing blood pressure were blinded to randomisation assignments. The primary endpoint, change in 24-h blood pressure at 3 months, was compared between groups. Drug surveillance was done to ensure patient compliance with absence of antihypertensive medication. The primary analysis was done in the intention-to-treat population. Safety events were assessed at 3 months. This study is registered with ClinicalTrials.gov, number NCT02439749.
